

## ASTM Standard Guide for Cybersecurity and Cyberattack Mitigation

The ASTM Standard Guide for Cybersecurity and Cyberattack Mitigation was developed by a team that involved members from the public and private sectors. This guide addresses the company or government organizational need to mitigate the likelihood of cyberattacks and reduce the extent of potential cyberattacks, which can leave sensitive personal data, corporate information, and critical infrastructure vulnerable to attackers. These recommendations are meant to serve as a guideline for corporate and government organizations to adopt for the protection of sensitive personal information and corporate data against hackers. For additional information, refer to <https://www.astm.org/search/fullsite-search.html?query=cybersecurity&toplevel=products-and-services&sublevel=standards-and-publications>.
